#### Problem 1:

Considering the orbit of Didymos from HW00:

- 1. Plot the specific energy of the orbit as a function of time.
- 2. Using the subplot function, plot the specific angular momentum magnitude and x, y, z components as a function of time.
- 3. Explain why the previous two plots indicate that your 2BP propagator is working properly.

#### Solution

#### Part A

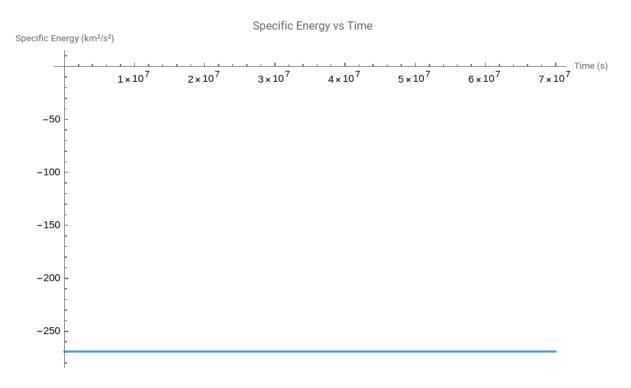

Figure 1: Didymos' Specific Energy vs. Time

```
_{1} (* Interpolated solutions for position and velocity *)
2 rDsol[t_] := Evaluate[rD[t] /. solDidymos[[1]]];
3 vDsol[t_] := Evaluate[vD[t] /. solDidymos[[1]]];
5 (* Specific energy: kinetic plus potential *)
  energy[t_] := 1/2 Norm[vDsol[t]]^2 - muSun/Norm[rDsol[t]];
_8 (* --- Plot the specific energy as a function of time --- *)
  energyPlot = Plot[
      energy[t], {t, 0, tmaxDidymos},
      PlotRange -> All,
11
      AxesLabel -> {"Time (s)", "Specific Energy (km\.b2/s\.b2)"},
      AxesOrigin \rightarrow {0,0},
13
      PlotLabel -> "Specific Energy vs Time",
14
      ImageSize -> Large
```

```
16 ];
17
18 (* --- Display the plot --- *)
19 Print[energyPlot];
```

#### Part B

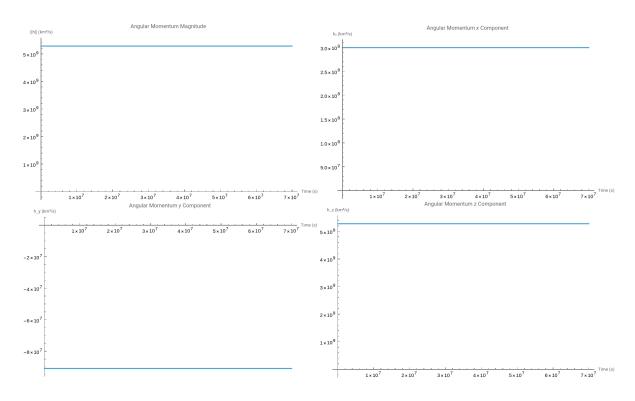

Figure 2: Didymos' Components of Specific Angular Momentum vs. Time

```
_{1} (* Specific angular momentum vector and its components *)
2 h[t_] := Cross[rDsol[t], vDsol[t]];
3 hMag[t_] := Norm[h[t]];
4 hX[t_] := h[t][[1]];
5 hY[t_] := h[t][[2]];
6 hZ[t_] := h[t][[3]];
  (* --- Plot the angular momentum quantities in subplots --- *)
9 hMagPlot = Plot[
      hMag[t], {t, 0, tmaxDidymos},
10
      PlotRange -> All,
11
      AxesLabel \rightarrow {"Time (s)", "||h|| (km\.b2/s)"},
12
      AxesOrigin -> {0,0},
13
14
      PlotLabel -> "Angular Momentum Magnitude",
15
       ImageSize -> Large
16 ];
17
18 hXPlot = Plot[
      hX[t], {t, 0, tmaxDidymos},
19
      PlotRange -> All,
20
      AxesLabel -> {"Time (s)", " h
21
                                         (km \setminus .b2/s)"},
      AxesOrigin -> {0,0},
22
      PlotLabel -> "Angular Momentum x Component",
```

```
ImageSize -> Large
25 ];
26
27 hYPlot = Plot[
      hY[t], {t, 0, tmaxDidymos},
      PlotRange -> All,
29
     AxesLabel -> {"Time (s)", "h_y (km\.b2/s)"},
30
     AxesOrigin \rightarrow {0,0},
     PlotLabel -> "Angular Momentum y Component",
      ImageSize -> Large
33
34 ];
36 hZPlot = Plot[
hZ[t], {t, 0, tmaxDidymos},
      PlotRange -> All,
      AxesLabel -> {"Time (s)", "h_z (km\.b2/s)"},
39
      AxesOrigin -> {0,0},
40
      PlotLabel -> "Angular Momentum z Component",
41
      ImageSize -> Large
42
43 ];
44
_{45} (* Arrange the angular momentum plots in a 2x2 grid *)
46 angularMomentumGrid = GraphicsGrid[
47
      {
           {hMagPlot, hXPlot},
          {hYPlot, hZPlot}
      },
      Spacings \rightarrow {2, 2}
51
52 ];
_{54} (* --- Display the plots --- *)
55 Print[angularMomentumGrid];
```

# Problem 2:

For what value(s) of the true anomaly is the flight path angle zero?

- 1. For a circle?
- 2. For an ellipse?
- 3. For a hyperbola?
- 4. For a parabola?

# Solution

Part A

 $\forall \nu \in \mathbb{R} \quad \Box$ 

Part B

 $\nu = 0^{\circ}, 180^{\circ}$ 

Part C

 $\nu = 0^{\circ}$ 

Part D

 $\nu = 0^{\circ}$   $\square$ 

# Problem 3:

The computer in Luke Skywalker's X-Wing is on the fritz. He sees Earth outside his window, and he knows his current altitude is  $6 \times 10^3$  km, his velocity is  $8.5 \, \frac{\mathrm{km}}{\mathrm{s}}$ , and his flight path angle is  $0.5^{\circ}$ . For this problem and all other problems involving Earth orbits in this assignment, use  $\mu = 3.986 \times 10^5 \, \frac{\mathrm{km}^3}{\mathrm{s}^2}$  and Earth Radius = 6378 km.

- 1. What type of conic is Luke's current orbit?
- 2. What is the semi-major axis of his orbit?
- 3. What is the specific angular momentum magnitude of his orbit?
- 4. What is the eccentricity of his orbit?
- 5. What is the radius of periapsis of his orbit?

#### Solution

Part A

$$\epsilon = \frac{v^2}{2} - \frac{\mu}{r}$$
$$\epsilon = 3.923 \frac{\text{kJ}}{\text{kg}}$$
$$\epsilon > 0 \quad \Box$$

 $\therefore$  The orbit is hyperbolic.

Part B

$$\epsilon = \frac{-\mu}{2a} \implies a = \frac{-\mu}{2\epsilon}$$
$$a = -50\,803\,\mathrm{km} \quad \Box$$

Part C

$$h = rv\cos\gamma$$
 
$$h = 105 209 \frac{\text{km}^2}{\text{s}} \quad \Box$$

Part D

$$p = a (1 - e^{2}) = \frac{h^{2}}{\mu}$$

$$\implies e = \sqrt{1 - \frac{h^{2}}{a\mu}}$$

$$e = 1.244 \quad \Box$$

Part E

$$r_p = a (1 - e)$$
 
$$r_p = 12377 \,\mathrm{km} \quad \Box$$

# Problem 4:

Consider an Earth-orbiting satellite with a semi major axis of  $2 \times 10^4$  km and an eccentricity of 0.4.

- 1. Calculate the radius of the satellite at a true anomaly of  $30^{\circ}$ .
- 2. Calculate the radius of the satellite at a true anomaly of 330°.
- 3. Calculate the velocity of the satellite at a true anomaly of  $30^{\circ}$ .
- 4. Calculate the velocity of the satellite at a true anomaly of 330°.
- 5. Calculate the flight path angle of the satellite at a true anomaly of 30°.
- 6. Calculate the flight path angle of the satellite at a true anomaly of 330°.
- 7. What is the radius of apoapsis of this orbit?
- 8. What is the velocity at apoapsis of this orbit?

## Solution

Part A

$$r = \frac{a(1 - e^2)}{1 + e\cos\nu}$$
$$r = 12478 \,\mathrm{km} \quad \Box$$

Part B

$$r(30^{\circ}) = r(330^{\circ})$$
  
 $\implies r = 12478 \,\mathrm{km} \quad \Box$ 

Part C

$$v = \sqrt{\frac{2\mu}{r} - \frac{\mu}{a}}$$
$$v = 6.63 \frac{\text{km}}{\text{s}} \quad \Box$$

Part D

$$r(30^{\circ}) = r(330^{\circ})$$

$$\implies v(30^{\circ}) = v(330^{\circ})$$

$$\implies v = 6.63 \frac{\text{km}}{\text{s}} \quad \Box$$

Part E

$$r_p = a (1 - e)$$
  
$$r_p = 12 \times 10^3 \,\mathrm{km}$$

$$v_p = \sqrt{\frac{2\mu}{r_p} - \frac{\mu}{a}}$$

$$v_p = 6.819 \frac{\text{km}}{\text{s}}$$

$$\gamma = \arccos\left(\frac{r_p v_p}{r v}\right)$$

$$\gamma = 8.43^{\circ} \quad \Box$$

Part F

$$r(30^{\circ}) = r(330^{\circ})$$

$$\implies v(30^{\circ}) = v(330^{\circ})$$

$$\implies \gamma(30^{\circ}) = \gamma(330^{\circ})$$

$$\implies \gamma = 8.43^{\circ} \quad \Box$$

Part G

$$r_a = a (1 + e)$$
  
 $r_a = 28 \times 10^3 \,\mathrm{km}$   $\square$ 

Part H

$$v_a = \sqrt{\frac{2\mu}{r_a} - \frac{\mu}{a}}$$
$$v_a = 2.923 \frac{\text{km}}{\text{s}} \quad \Box$$

# Problem 5:

Consider an Earth-centered orbit with a radius of periapsis of  $1 \times 10^4 \, \mathrm{km}$  and accentricity of 1.

- 1. What is the velocity at periapsis?
- 2. What is the radius of apoapsis?
- 3. What type of conic is this orbit?

## Solution

#### Part A

$$v_p = \lim_{a \to \infty} \sqrt{\frac{2\mu}{r_p} - \frac{\mu}{a}}$$

$$v_p = 9.929 \frac{\text{km}}{\text{s}}$$

$$v = 8.929 \frac{\text{km}}{\text{s}} \quad \Box$$

#### Part B

For parabolic orbits, the craft will escape the gravitational pull of the planet, and thus there is neither an apoapsis nor a radius of apoapsis.

$$r_a = \infty$$
  $\square$ 

Part C

$$e=1$$

: The orbit is parabolic.
